

Wi-Fi (Windows 11, PEAP)

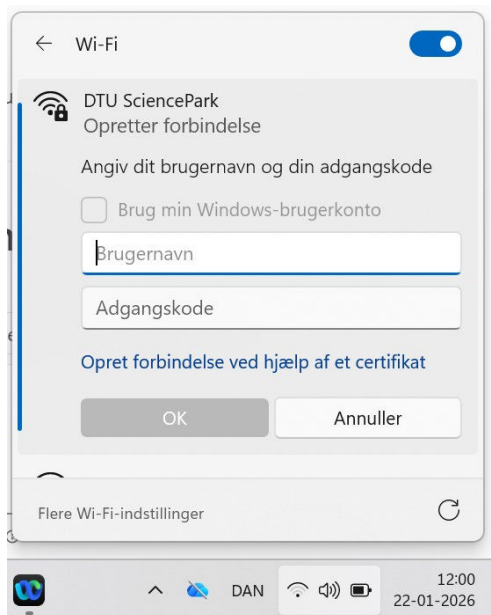

Prerequisites

- SSID: "DTU SciencePark"
- Username/password from the welcome email
- Validate the server certificate on first connection (TOFU), or pre-install the CA in the Windows Trusted Root store

Step-by-step

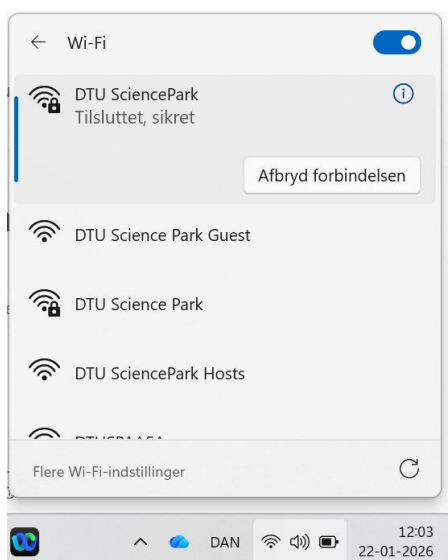

1. Select the SSID "DTU SciencePark".

Windows will prompt you for your username and password (PEAP/802.1X).

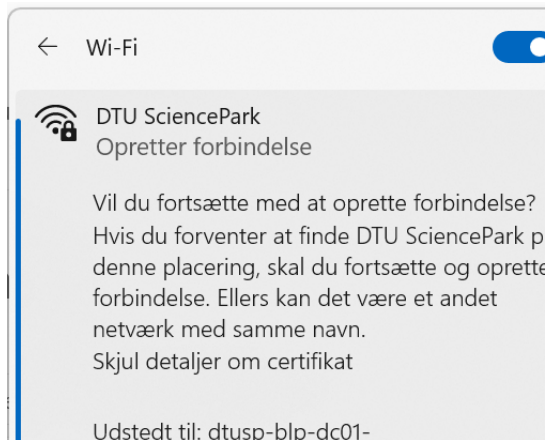

2. Enter your username and password.

Click OK to start the connection.

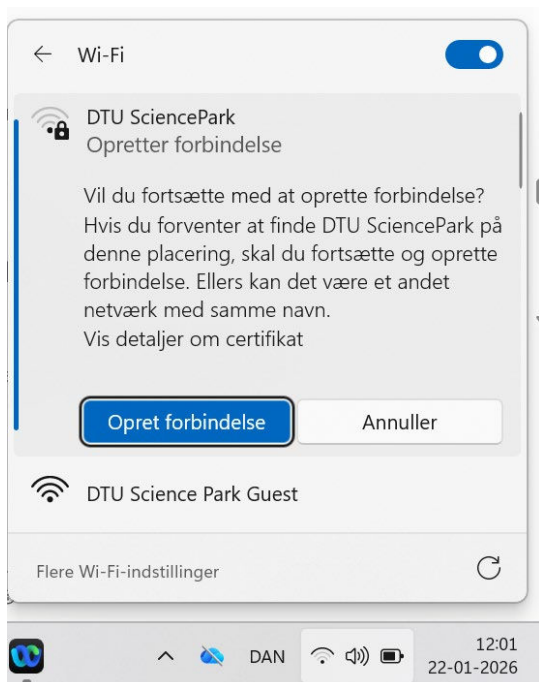

3. Confirm the certificate dialog (first time only).

Verify that "Issued to" shows dtusp-blp-dc01-fauth01.dtusciencepark.dk and that the issuer is "Go Daddy Secure Certificate Authority – G2". Select "Connect".

4. Verify that the status is "Connected, secured".

The connection is now established using **WPA-Enterprise**.

Troubleshooting (brief)

- Incorrect certificate name/issuer: Cancel and contact IT; install the correct CA if necessary.
- Login fails: Check your username/password and try again.
- Repeated prompts: Delete and recreate the profile in Wi-Fi settings.
